Optical material / crystals (Infrared)

Material / Specification: Germanium for 1.8µm to 23µm transmission
Range / Description: OPMI-GERMANIUM

Germanium is a hard, grayish-white element that has a metallic luster and the same crystal structure as diamond. Germanium is a highly important infrared optical material and can be readily cut and polished into lenses and windows. It is used particularly as the front optic in thermal imaging cameras working in the 8 to 14 micron wavelength range for passive thermal imaging and for hot-spot detection in military and fire fighting applications.
